Aim to fill 5 boxes in a line (i.e. row, column or diagnonal) with no gaps. i.e. consecutive boxes.

How to fill boxes...

1. Roll a 10 sided dice, or obtain a random whole number from 1 to 10.

2. Repeat step 1.

3. The player then fills a square with a cross as follows....

If the 2 random numbers are 3 and 5 (say), determine the product. This is 15. The players can then place a cross in any pairing of numbers which has a product of 15.
eg (3, 5) or (5, 3). Using the grid over the page as an example, let's assume they choose (5, 3).

4. Repeat steps 1 and 2.

Let's say the next 2 numbers are 6 and 6. The product is 36.
Possible boxes are (6, 6), (4, 9) or (9, 4). Let's assume the player chooses (4, 9).

5. Repeat steps 1 and 2.

Let's say the next 2 numbers are 6 and 5. The product is 30.
Possible boxes are (6, 5), (5, 6), (10, 3) or (3, 10). Let's assume the player chooses (5, 6).

6. Keep repeating steps 1 and 2 until a player can shout "Bingo" which implies they have achieved filling 5 boxes in a line.
